

WaveWare LED Sign Control Software

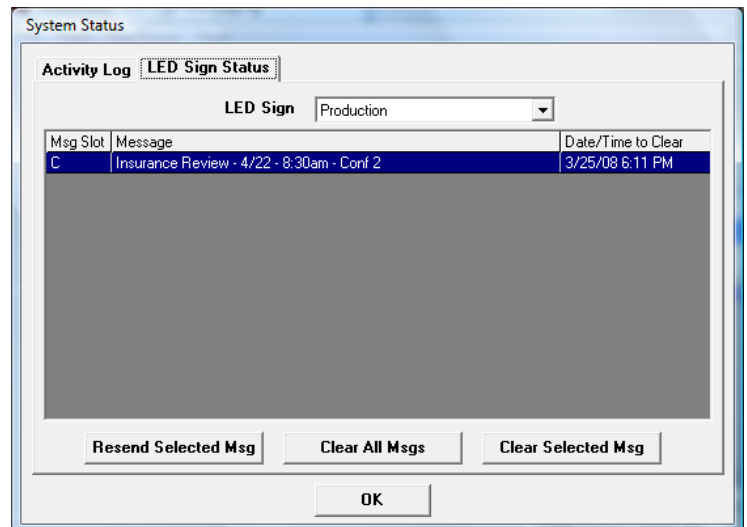

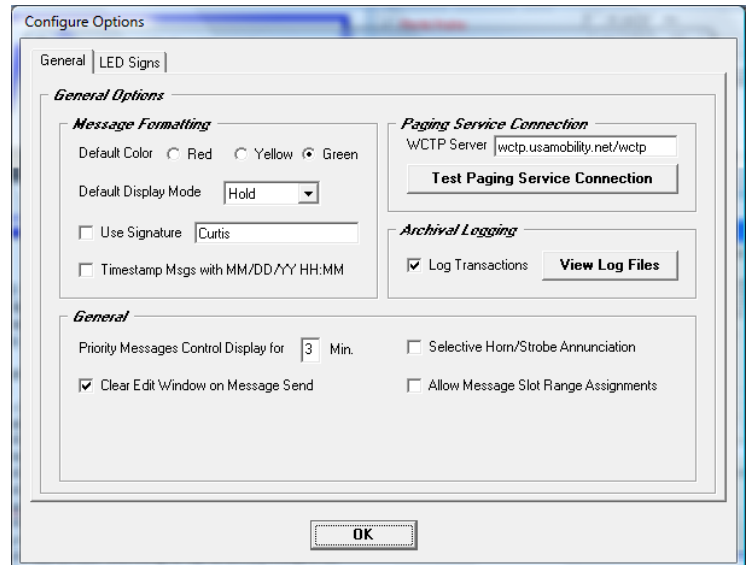

"We Deliver Information at the Speed of Light"

The LED Sign Messaging software is designed to control Adaptive LED message boards via wide area paging services. The software has the following features:

- Configurable to a wide range of Adaptive LED sign models
- Controls multiple individual LED signs
- Control text color, display mode, text style, and display speed
- Automatic message removal by assigning a run time value to a message
- Tagging of a single message as priority
- Selective control of optional horn/strobe annunciator
- Simulation of message display prior to sending message
- Automatic stacking of up to 24 messages
- Older messages are replaced by newer messages, in FIFO order
- Multiple LED Sign Messaging software systems can share the same LED message board(s)
- Selective manual removal of an active message from the message stack
- Manual clearing of all messages from the display
- Resend selected messages from status log
- List of predefined messages
- Uses WCTP protocol to connect to a paging service provider over the internet
- The LED Sign Messaging software supports only one capcode per sign. If multiple signs have the same capcode, you can broadcast to all of those signs.
